

KC Stock Re-order

Advanced accounts integrated software solutions

For use with

OPERA^{II}

Take the headache out of stock re-ordering with KC Stock Re-Order

Linking seamlessly with stock and purchase order processing in Pegasus Opera II, KC Stock Re-Order will suggest order quantities for goods based on predicted requirements.

This easy to use module has two optional modes of operation: -

- » Average Mode
- » Seasonal Mode

In average mode KC Stock Re-Order will look at stock requirements and use over a period of time - and you control how far back you would like it to calculate.

When in seasonal mode, KC Stock Re-Order examines the peaks and troughs of the previous years' demands and estimates stock requirements for the present year, based on them. There is a method to account for planned growth with a built-in forecast percentage increase option.

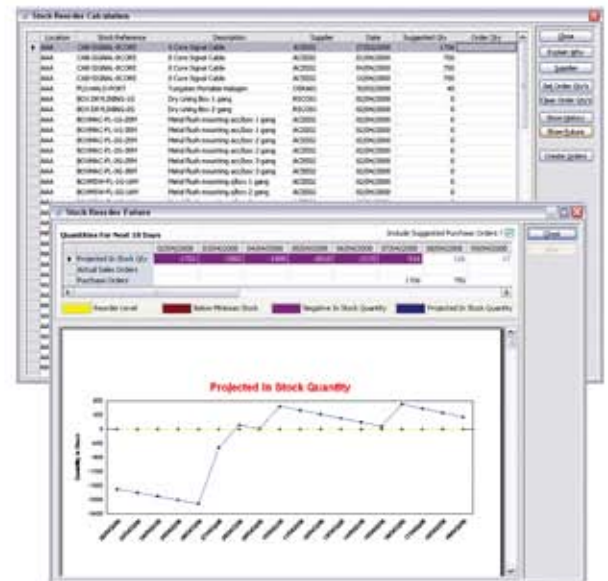

KC Stock Re-Order takes into account lead times per specific item, maintaining that you only order what you need - when you need it. This helps to minimise stock holdings whilst still meeting current customer demand.

There are options within KC Stock Re-Order to run calculations based on stock code, product groups or even supplier, and the systems will look at predicted demand, stock-in-hand as well as any expected or pending deliveries before providing a 'suggested order' value.

Designed as a time saving and cost saving tool, KC Stock Re-Order does not remove control from the experienced Warehouse Manager. A simple grid allows the user to accept, reject or amend suggested orders. Once happy, a click of a button will raise all the required purchase orders.

Orders are raised per supplier so that only one order is raised no matter how many items are required so you will automatically take advantage of any savings in delivery charges.

A 'view' button allows you to drill down to any suggested stock item and automatically see what is in stock, pending purchases and sales, lead times and preferred supplier - all in one easy-to-read screen.
